

6/12/22 Atlantic County Commission Meeting -Public Comment on Elections

The information I am presenting is available at website ElectionsDeclassified.com.

This website is best viewed on a computer, not a phone.

There is Bi-Partisan Agreement...

Electronic voting machines can facilitate the rigging of elections by enemies foreign and domestic.

The manufacturer's will not allow us to see their computer coding and will sue anyone who suggests their machines may have been used to rigged election outcomes. They wine and dine election officials at so called training junket vacations while giving glowing sales pitches about their systems.

On the website, you will find many experts explain how it is done. They will also explain the only way to ensure this cannot happen is to get rid of them.

To have confidence in the outcome of any election, we must have:

- (1) real paper ballots (machines MUST go to the trash heap)
- (2) hand counted same day in a bipartisan transparent process, and
- (3) citizen voter ID.

Without this, all other efforts may be in vain.

In 2004, Clinton Curtis, an American attorney, computer programmer and ex-NASA employee (also Speaker of the House of Florida at the time), admits that elections can indeed be fixed & it would be undetectable.

I'd like to read an excerpt of his sworn testimony before the U.S. HOUSE OF REPRESENTATIVES Democrats of the Judiciary Committee, December 13, 2004.

This can be seen on my website at the top of the home page, also.

ARNEBECK: Mr Curtis, are there programs that can be used to secretly fix elections?

CURTIS: Yes.

ARNEBECK: How do you know that to be the case?

CURTIS: Because in October of 2000 I wrote a prototype for present Congressman Tom Feeney, at the company I work for in Oviedo, Florida, that did just that.

ARNEBECK: And when you say, "Did just that," it would rig an election?

CURTIS: It would flip the vote fifty-one forty-nine to whoever you wanted it to go to, and whichever race you wanted it to win.

ARNEBECK: And would that program that you designed be something that elections officials, that might be on county boards of elections, could detect?

CURTIS: They'd never see it.

ARNEBECK: Would you answer that question once again?

CURTIS: They would never see it.

After consultation with Mr. Curtis and others, Germany, Netherlands and Italy got rid of their electronic voting machines. France uses paper ballots and voting is done in one day.

The programming and vulnerabilities of the voting machines has only gotten more sophisticated and corrupt. You will also find information on Elections Declassified.com exposing the true nature of another system you are planning to implement...ERIC or Electronic Registration Information Center. Please be sure to review it.
